ISU researchers publish national study on cyberbullying of LGBT and allied youths

AMES, Iowa - Schools are typically on guard against students who bully by inflicting repeated violence on other students. But technology has given rise to a relatively new form of bullying which inflicts emotional harm in a stealth manner, working through Web sites, chat rooms, e-mail, cell phones and instant messaging.

And according to a new national study by Iowa State University researchers, one out of every two lesbian, gay, bisexual, transgender (LGBT) and allied youths are regular victims of "cyberbullying," which causes psychological and emotional distress to victims -- producing thoughts of suicide in some who are repeatedly victimized.

In the online survey of 444 junior high, high school and college students between the ages of 11 and 22 -- including 350 self-identified non-heterosexual subjects -- 54 percent of the LGBT and allied youth reported being victims of cyberbullying in the 30 days prior to the survey. Cyberbullying includes attacks such as electronic distribution of humiliating photos, dissemination of false or private information, or targeting victims in cruel online polls.
